

SE FIREMAP

An improved system for mapping fires across the Southeastern U.S.

BACKGROUND:

More effective spatial tracking of wildland fire and understanding fire patterns across the Southeast landscape are critical needs identified by a consortium of conservation partners, including members of the Southeast Regional Partnership for Planning and Sustainability (SERPPAS) and America's Longleaf Restoration Initiative (ALRI). In 2020, the USDA Natural Resources Conservation Service (NRCS) provided funds through an agreement with the U.S. Endowment for Forestry and Communities (Endowment) to support a new "SE FireMap" product. The improved accuracy and comprehensive coverage of this SE FireMap will promote better decision-making to prioritize funding for staff, projects, training, equipment and more. Fire is key to healthy native landscapes in the Southeast to keep "working lands" working, restore the longleaf pine ecosystem, support the Department of Defense's military and training missions, conserve listed and at-risk species, manage for wildfire risk, and minimizing the need to conserve species through regulation. The importance of enhancing and expanding prescribed burn management cannot be overstated - it is imperative that we have a reliable method to select priority geographies to manage natural resources and wildfire risk.

Objectives:

- Develop a cohesive system using remote sensing to track both prescribed fires and wildfires across the Southeast, providing significantly improved resolution over other regional and national systems currently in use;
- Identify priority databases already in use by partners to test mapping accuracy and help train the SE FireMap toward reducing error rates;
- Provide comprehensive coverage of both public and private lands;
- Seek to achieve a mapping scale that balances the desire to support site-specific management decisions with the ability to ensure accuracy;
- Coordinate continuously with fire mapping experts within the U.S. to facilitate future expansion of this project to include other regions, especially the Western U.S.;
- Deliver the SE FireMap online for public use as a decision support tool "dashboard" with standard query options, as well as spatial data and pdf map downloads, to promote the efficiency and effectiveness of fire management toward conservation, economic and public safety goals.

PROCESS:

The Endowment and NRCS are leading a regional consortium of partners to conduct the work and partnered with The Longleaf Alliance (TLA) to serve as project lead and establish a technical oversight team (TOT) for the project; subject matter experts nominated by ALRI and SERPPAS partners. The TOT consists of ten members who are guiding the project through all phases of development. This project has been separated into a "Scoping Phase" and "Development Phase" with a target completion date in 2022.

Scoping Phase:

To ensure product quality, a Request for Proposals (RFP) was released in 2019 for a national assessment of existing spatial information, models, remote sensing, other tools and approaches relevant to developing an improved fire mapping system. Tall Timbers Research, Inc. (TTR) was chosen to receive this award and is currently leading the scoping effort. Deliverables from the Scoping Phase will consist of recommendations for reference mapping products and tools, methodologies, priority databases to test and train the map, and budget estimates for the Development Phase of the SE FireMap. As a direct result of initial recommendations, the Scoping Phase is also culminating in the release of a Version 1.0 (v.1) beta or "pilot" SE FireMap product. The v.1 web map and data are intended for utilization by 3rd parties; however, a key element of this beta version is the opportunity for partners to provide feedback on appropriate use, interpretation, and underlying data limitations.

Development Phase:

Based on recommendations from the Scoping Phase, next steps for development of the SE FireMap will be decided by the sponsors and the Technical Oversight Team. Building from the v.1 product, an updated and refined version of the SE FireMap is anticipated in 2022.
